They regarded it not only as one of the three or four generalizations upon which the new physical chemistry rests, but as being of scarcely less importance for the whole subject of general inorganic chemistry. At that time the wide-reaching significance of this theory for general chemistry was not fully appreciated by those who have to teach this subject. In the last few years a marked change has come about. The Theory of Electrolytic Dissociation has found its way not only into the teaching of advanced inorganic chemistry, but is now introduced by the progressive teachers into their elementary courses. This change has been brought about largely by the recognition of the fact that this generalization correlates great masses of facts which hitherto have been regarded as more or less disconnected, and thus an important step is taken towards placing chemistry on the basis of an exact science. The recognition of the fact that it is the charged parts or ions, and not the uncharged atoms or molecules that are the chemically active agents, has changed, fundamentally, the teaching and study of general chemistry. The next few years will probably see a still more general adoption of the newer conceptions. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books.
