Brand New Book \*\*\*\*\* Print on Demand \*\*\*\*\*.Excerpt from The Naturalist: The Growth of the Horns of the Red Deer Shortly after shedding the first horns, the formation of the second takes place according to the same process, and these are shed in the latter end of April or beginning of May, when they will have attained a length of nearly two feet, or perhaps more; these in turn drop off, to be again renewed, and thus the same process is continued for a series of years, except some casualty should happen to his head, or generative powers, whereby the growth of horns becomes immediately arrested, as has been clearly and satisfactorily proved. Several years since there came into my possession a young male red deer, only a few days old. Just then the Rev. J. Boyce, (or as he was familiarly termed stag-hunter Boyce, ) happened to pass through Lynton, on his journey to Porlock, and I had some conversation with him respecting stag-hunting and the red deer. Knowing him to be the oldest stag-hunter, and one who had been present at more deaths of the wild red deer in the county than any other living being, I in the course of conversation, asked him whether he could tell, or if he thought it possible for any one to tell the age of a stag by his horns.
